### Description

There's a Gedcom viewer (for Genealogy researchers) that's called PhpGedView (www.phpgedview.net) that looks like a completely awesome online family tree viewer/updater. Looks really well done. There is already a module written for it for PhpNuke, and I think it would be pretty cool if a module was written to interface it with TikiWiki.

I've looked at a lot of genealogy products and most do not provide an intuitive approach that anyone can understand. I do have a suggestion for an alternative that I'd be happy to show to anyone and share.

I use PhpGedView and agree that it would be wonderful if the two could be integrated like it already is with Joomla, the various Nukes, Joomla. Genealogy is a natural community activity and incredibly popular. I'd be willing to help with testing, documentation etc. and any other way I can.

I use Tiki for my main family site and just installed PhpGedView as a more interactive genealogy app. It would be great to use Tiki as the front-end with a single sign on.
