Description
    When a user fills the e-mail address field at tiki-send_blog_post.php?postId=XX with non-email-string, an e-mail per sentence is tried to send from the server.

    A simple check for a well written e-mail adress in the field should prevent silly mistakes from novice users in tiki, but very annoying for the server mailing efficiency and sys admin annoyance redirecting mal-formed e-mail...

    It happens in 1.8.5, and also in 1.9.0.

Solution
    Check has been implemented

    Tested on 1.9.11, 2.1 and 2.3

Importance
    5

Priority
    25

I have now hhad my domain catch-all mailbox flooded with 30,000 bounced mails as a spammer manage to abuse this with casino ads. They failed to actually do anything but really annoy me, but fixing this and making sure it is in the latest releases would prevent such an attack (which actually clogged my mail box sufficiently to cause me problems).
